

matev presents innovations for grounds care

Press Release
Juni 2023

At this year's demopark from June 18th to 20th, 2023, matev GmbH from Langenzenn will showcase its wide range of tractor basic equipment and attachments for green area maintenance, as well as for dirt removal and winter services. Various new products have also been introduced by matev at Europe's largest outdoor exhibition for the green industry.

Langenzenn / June 16, 2023 – The demopark in Eisenach is once again a highlight in matev's trade fair calendar this year. At booth B-255, visitors can experience matev GmbH's attachments live for three days and be convinced of the quality of the equipment. In addition to the proven range of tractor basic equipment such as front linkages and a wide range of attachments, various new developments will be presented.

New Streetfighter in matev's sweeping machine range

In the grounds care program, matev presents its latest innovation: the sweeping machine SWE-57, which is being introduced for the first time at demopark. It has been specially designed for use with compact tractors with a power range of 30-60 HP. With its robust steel frame, the SWE-57 series sweeping machines are ideal for professional use in municipalities and service providers. It will initially be available in working widths of 140, 160, and 180 cm.

The new feature of this matev sweeping machine is the side drive with a chain gear as an extension of the existing matev product line with center drive. While deviating from their previous line of exclusively producing center-drive sweeping machines, matev follows the saying of Goethe: "Everyone should sweep in front of their own door, and the world will be clean."

One particularly innovative aspect is the easy adjustment of the input speed, which can be achieved with few parts, enabling easy handling and maintenance. This allows the sweeping machine to be adapted to the specific requirements and speeds of the tractor. In addition, by rotating the gearbox, a quick and uncomplicated switch between CW and CCW rotation can be achieved.

The SWE-57 comes standard with pendulum compensation to optimize the sweeping machine's adaptation to different surfaces. The particularly uncomplicated height adjustment of the sweeping roller contributes significantly to efficient and precise adjustment of the machine to various surfaces.

The change of sweeping rollers is simple and uncomplicated, increasing the flexibility and versatility of the sweeping machine. This allows different sweeping rollers to be used for various applications. Overall, the SWE-57 with side drive offers a powerful solution for professional use, meeting the requirements of municipalities and service providers.

Proven suction performance in a new product

matev GmbH also presents an innovative product novelty with the MRM-120 AS suction sweeper system. The system features active suction that directs the collected material into

Presse release

any collection container. The system has a working width of 120 cm and can be optionally expanded with two side brushes, increasing the overall working width to 2.1 m. The active suction can also be purchased as a retrofit kit for the current MRM-120 suction sweeper.

The MRM-120 AS suction sweeper system offers an effective cleaning solution with high quality and performance. The system uses the same turbine for active suction as the proven matev CLS material collection devices that have already established themselves in the market for years. Thus, the MRM-120 AS suction sweeper system is a durable and reliable technology that meets the daily requirements of the working environment.

The hydraulically driven rotor brush of the system ensures perfect cleaning results for leaves, grass clippings, dirt, and debris, including wet and compacted sweepings. The active suction allows flexible and quick disposal.
